

Barrier Treatment Mosquito Control

Barrier Treatment is the technique of using a mist blower/sprayer(Non ULV) and a water based emulsifiable pesticide and applying this product to tall grass, plants, shrubs, etc in areas inaccessible to fogging or mowing. Barrier Treatment is not new, but is a rarely used application that is extremely effective on day biting mosquitos like aedes albopictus (Asian Tiger) and aedes aegypti (yellow fever), both in Texas and known Zika carriers.

Unlike mosquito fogging, Barrier Treatment is a daytime operation that doesn't require expensive equipment or chemical. Mosquitos look for cool places to hide away during the heat of the day, and treating their hideouts is made easy with the right equipment and chemical

Phesco International offers a Maruyama MM300 backpack mister or the Arro-Gun Bullet handheld gas powered mister/ULV fogger. We also provide Permethrin 10% EC concentrate for an effective treatment of the mosquito nuisance.
